

Hi, I'm Runwave.

Your solution for more predictable and safer traffic.

Your pilot community's solution for smoother flying.

"TOTAL" AIRPORT MANAGEMENT?

Collaborative Decision Making for your airport's General Aviation Community

At many airports, runway capacity is becoming an increasingly scarce resource. To tackle this, airports, airlines and air traffic control are collaborating more and more to ensure the most efficient operation possible.

General Aviation (GA) has been left out of this development due to its unscheduled nature. As a result, GA traffic causes unpredictable runway usage behavior and delays. At the same time, the GA community is underrepresented in the capacity allocation process.

"A pilot's go-to destination for making smoother flight plans, with less waiting at the runway"

What if runway capacity could be allocated dynamically to the GA community to optimally fit their needs, whilst increasing predictability of your runway operations?

Runwave is a new and unique platform for collaborative decision making in the General Aviation community. It is a pilot's go-to destination for making smoother flight plans with less waiting.

Runwave helps pilots with executing their flights in a reliable manner, and allows airports to make optimal use of available capacity.

More insight, more grip: The Runwave Dashboard

Runwave comes with an advanced dashboard for managing, analyzing and optimizing your airport's GA operations. Some of its main features are:

- Get live overviews of upcoming GA movements, including visualized traffic peaks and KPIs
- Generate traffic reports to share with operations
- Manage runway availability: Indicate maintenance periods and other runway closures
- Communicate directly to your community: Send push messages and updates to pilots

runwave

Core Features

- Users indicate runway usage and share this with the community, such that everyone can optimize their flight planning
- Integration with AODB for inclusion of scheduled flights into capacity model
- A probability-based algorithm creates accurate traffic forecasts whilst maintaining flexibility for pilots
- Support for VFR, IFR, Circuit and Helicopter operations
- Support for separate FATO areas
- Cloud-based solution, integration with airport and weather systems supported
- Android, iOS and Web App
